                                                                                                                                                       -!- FUNCTION: NEUROTOXIN, BINDS AND INHIBITS NICOTINIC RECEPTORS.
COMPARED TO ALPHA-NEUROTOXINS, KAPPA-NEUROTOXIN BIND MORE STRONGLY
TO NEURONAL RECEPTORS, AND LESS STRONGLY TO NEURONAL RECEPTORS.
-!- SUBCELLULAR LOCATION: Secreted.
-!- IISSUE SPECIFICITY: Expressed by the venom gland.
-!- SIMILARITY: Belongs to the snake toxin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           22 RICLISPS-----STPQTCPNGQDICFRKAQCDNFCHSRGPVIEQGGVATCPQFRSNY

--- SUBCELLULAR LOCATION: Secreted.
--- TISSUE SPECIFICITY: Expressed by the venom gland.
--- MISCELLARDGUS: LD(50) is 0.05 mg/kg by subcutaneous injection.
--- SIMILARITY: Belongs to the snake toxin family.

                                                                                                      The present sequence is human LK7 protein which contains the amino acid sequence of human apolipoprotein(a) kringle domain LY37 (LK1V37). The human apolipoprotein(a) kringle domains LY36 (LK6 protein), 1V37 (LK7 protein) and V38 (LK8 protein) together form the angiogenesis inhibitors LK68 protein. LK68, LK6, LK7 and LK8 are inhibitors are of endothelial cell proliferation, cell migration and normal development of capillaries in the chick embryo choricallantoic membrane (CAM). LK68 protein, its single kringles or their functional equivalents, are useful for treating angiogenesis-mediated diseases, such as cancer, rheumatoid arthritis, psociasis or coular angiogenic disease in animals or humans. LK68 is useful as an anticancer agent and
            Novel angiogenesis inhibitor, LK68 for treating angiogenesis-mediated diseases, e.g. cancer and rheumatoid arthritis, has human apolipoprotein(a) kringle domains IV36, IV37 and V38 amino acid

The invention provides fragments of kringle 1, 2 or 4 of human plasminogen that contain a lysine binding site and have anti-angiogenic activity. The peptides of the invention function as antiangiogenic agents, for the treatment process and diseases involving angiogenesis. Such diseases include cancers such as solid timours, blood born tumours such as leukemias, tumours metastasis, benign tumours such as themangiomas, acoustic acuromas, neurofilbromas, trachomas and pyogenic granulomas, rheumatoid arthritis, ocular angiogenic diseases such as dabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, Osler-Webber syndrome, myocardial angiogenesis, plaque neovascularization, telangiectasia, hemophiliac joints, angiofibroma, and wound granulation. The fragments are also useful in treatment of disease of axcessive or abnormal stimulation of endothelial cells. These disease include intestinal adhesions, atherosclerosis, soleroderma, and hypertrophic scars. The fragments can be used as birth control agents by preventing vascularization required for embryo transplantation. The present sequence of human plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 VRQCYHGNGQSYRGTFSTTVTGRTCQSWSSMTPHRHQRTPENYPNDGLTMNYCRNPDADT

                                                                                                                                                                                                                                                                               The specification describes a human polypeptide which is a potent anglogenesis inhibitor, and is designated KED. KED polypeptide, Kringle proteins, or a kringle derived from human tissue plasminogen activator (tPA) protein are used to inhibit anglogenesis. Kringle protein, KED or tPA are useful for treating tumours, as well as atherosclerosis, arthritis, retinopathy and other similar diseases. KD is also useful for the treatment of diseases such as bronchial vascular congestion, inflammatory bowel disease, adult respiratory distress syndrome,

                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
Castleman's disease, psoriasis, hepatitis, aneurysm, renal disease and haemangioma. The present sequence represents kringle 4 of human plasminogen, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           angiostatin; plasminogen; kringle; angiogenesis; cancer; arthritis; macular degeneration; diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Use of angiostatin fragments or aggregates - for inhibiting endothelial cell proliferation and treating angiogenesis-mediated diseases, e.g. cancer, arthritis or diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                antibodies for use in diagnosis, detection and therapy.
The present sequence, human kringle 4, is a specific angiostatin fragment which can be used in the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to new methods and compositions for inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 2, kringle 1-3, kringle 1-2, kringle 1-2, kringle 1-2, kringle 1-2, kringle 1-2, kringle 1-4 or kringle 1-4 mino acid number 98 of murine, human, Rhesus, porcine of bovine plasminogen. The active component can be used for treating anglogenesis-mediated diseases such as cancer, arthritis, macular degeneration and diabetic retinopathy. It can also be used to develop

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABM15762 to ABM27252 encode the human OREX proteins given in ABP00010 to ABP1500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide syndrome associated with ORFX-associated disorder. ORFX polynucleotide treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders, infectious transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypertension, hypothyroidism, cholesterol ester stroage disease, various immune disorders and disorders, infectious also disease and autoimmune disorders with a multiple sclerosis, rheumatoid arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. Ost transitis autoimmune manulamenter experience in the protein and autoimmune inflammatory eye disease. Ost transitis and disconders in the protein and autoimmune inflammatory eye disease. Ost transitis and autoimmune inflammatory eye disease. Ost transitis and disconders in the protein and autoimmune inflammatory eye disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorthage; degenerative disorder; osteoarthrits; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypertyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;

                                                                                                                                                       g
                                                                                                                                                                                  δă
                                                                                                                                                                                                                                                                                   The invention relates to a method of preparing plasminogen kringle 5 peptide fragments. The method comprises mixing mammalian plasminogen and elastases in the ratio 1:100-1:300, followed by incubating and isolating to the fragment. The kringle 5 peptides are inhibitors of angiogenesis and enothelial cell proliferation and migration. The peptides are useful for treating angiogenic diseases, primary and metastatic solid tumours of and carcinomas of various organs such as breast, genifical temours and carcinomas of various organs such as leukaemias and carcinomas of various used for the brain and eyes and solid tumours arising from haematopoletic malignancies such as leukaemias and lamphomas. They are also used for the prophylaxis of various autoimmus (1900, promises of e.g., rheumatoid arthitis), coular diseases (e.g., rheumatoid arthitis), coular diseases, skin diseases (e.g., rheumatoid arthitis), coular diseases, skin diseases (e.g., rheumatoid arthitis), ocular diseases, skin diseases (e.g., rheumatoidenesis as a pathologic consequence (e.g., cat scratch disease and ulcers). The peptides are also useful as a birth control agant which inhibits ovullation and satablishment of the placenta.

Comported the prophilation and astablishment of the placenta.

Inhibiting endothalial call proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 2-3, kringle 1-3, kringle 1-48KLS protein. The aggregate angiostatin has a Mol. Wt. of 45-65 kD and is derived from a plasminogen fragment beginning at approximately amino acid number 98 of murine, human, Rhesus, porcine or bovine plasminogen. The active component can be used for treating angiostation and diabetic retinopathy. It can also be used to develop antibodies for use in diagnosis, detection and therapy
                                                                                                                                                                                                                                                                                                                     angiostatin; plasminogen; kringle; angiogenesis; cancer; arthritis; macular degeneration; diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Use of angiostatin fragments or aggregates - for inhibiting endothelial cell proliferation and treating angiogenesis-mediated diseases, e.g. cancer, arthritis or diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence, human kringle 3, is a specific angiostatin ich can be used in the invention, and represents amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to new methods and compositions for inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, a combination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1.2, kringle 2.3, kringle 1.2, kringle 1.2, kringle 1.2, kringle 1.4 or kringle 1.4

The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 2-3, kringle 1-3, kringle 1-2, kringle 1-4 or kringle 1-4 protein. The aggregate angiostatin has a Mol. Wt. of 45-65 kD and is derived from a plasminogen fragment beginning at approximately amino acid number 98 of murine, human, Rhesus, porcine or bovine plasminogen. The active component can be used for treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               angiogenesis-mediated diseases such as cancer, arthritis, macular degeneration and diabetic retinopathy. It can also be used to develop antibodies for use in diagnosis, detection and therapy.

The present sequence, Rhesus kringle 3, is a specific angiostatin fragment which can be used in the invention, and represents amino

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to new methods and compositions for inhibiting endothelial cell proliferation, using as active component an angiostatin fragment, accombination of angiostatin fragments, or aggregate angiostatin. The fragment is preferably derived from murine, human, Rhesus, porcine or bovine plasminogen and is a kringle 1, kringle 2, kringle 3, kringle 23, kringle 1-3, kringle 1-2, kringle 1-4 or kringle 1-4 bKLS protein. The aggregate angiostatin has a Mol. Wt. of 45-65 kD and is derived from a plasminogen fragment beginning at approximately amino acid unmber 98 of murine, human, Rhesus, porcine or bovine plasminogen. The active component can be used for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 CMHCSGENYEGKIAKTWSGRDCQAWDSQSPHAHGYIPSKFPNKNIKMNYCRNPDGEPRPW 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4 CYHGNGQSYRGTFSTTVIGRTCQSWSSMTPHRHQRTPENYPNDGLTMNYCRNPDADTGPW 63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anglogenesis-mediated diseases such as cancer, arthritis, magniar degeneration and diabetic retinopathy. It can also be used to develop antibodies for use in diagnosis, detection and therapy.

The present sequence, bovine kringle 2, is a specific anglostatin fragment which can be used in the invention, and represents amino acids 88-165 of bovine anglostatin.
                                                                                                                                                                    angiostatin; plasminogen; kringle; angiogenesis; cancer; arthritis; macular degeneration; diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                     Use of angiostatin fragments or aggregates - for inhibiting endothelial cell proliferation and treating angiogenesis-mediated diseases, e.g. cancer, arthritis or diabetic retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                angiogenesis inhibitor, and is designated KED. KED polypeptide, kringle proteins, or a kringle derived from human tissue plasminogen activator (LPA) protein are used to inhibit angiogenesis. Kringle protein, KED or tPA are useful for treating tumours, as well as atherosclerosis, arthritis, retinopathy and other similar diseases. KED is also useful for the treatment of diseases such as bronchial vascular congestion, inflammatory bowel disease, adult respiratory distress syndrome,
                                                                                                                                                                                                                                                                                            tissuė plasminogen activator; tumour; atherosclerosis; arthritis; retinopathy; bronchial vascular congestion; inflammatory bowel disease; adult respiratory distress syndrome; Castleman's disease; psoriasis; hepatitis; aneurysm; renal disease; haemangioma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3 QCYHGNGQSYRGTFSTTVTGRICQSWSSMTPHRHQRTPENYPNDGLTMNYCRNPDADTGP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cattleman's disease, psoriasis, hepatitis, anerrysm, renal disease and haemangioma. The present sequence represents kringle 3 of human plasminogen, which is used in the course of the invention.
                                                                                                                                                                                                                                                             Angiogenesis inhibitor; KED; kringle protein; angiogenesis; tPA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Use of kringle protein and kringle derived from plasminogen and composition comprising kringle proteins for treating tumor and atherosclerosis, arthritis and retinopathy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ..

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 19,

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -I-FUNCTION: NEUROTOXIN, BINDS AND INHIBITS NICOTINIC RECEPTORS.
COMPARED TO ALPRA-NEUROTOXINS, KAPPA-NEUROTOXIN BIND MORE STRONGLY
TO NEURONAL RECEPTORS, AND LESS STRONGLY TO MUSCLE RECEPTORS.
-I-SUBCELLULAR LOCATION: Secreted.
-I-TISSUE SPECIFICITY: Expressed by the venom gland.
-I-SIMILARITY: Belongs to the snake toxin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
